

## Flux applicator pen empty refillable model FD-1104-P - WL22044

Item no. WL22044

Manufacturer A1-ESD

An empty applicator pen you fill with the flux your process actually approves. The FD-1104-P releases the medium through a felt tip in controlled, low-drip amounts instead of flooding a whole board. Made for rework, repair and precise wetting of individual pads.

### DESCRIPTION

Applying flux from a bottle during board rework almost always puts down too much and adds cleaning time afterwards. The empty FD-1104-P applicator pen is filled with your own flux and dispenses it through the felt tip exactly where it is needed.

### BENEFITS

- Supplied empty, so it can be filled with the flux released for your process
- Felt tip for metered, low-drip application onto single pads and component leads
- Refillable and therefore more economical than disposable pens
- Handy pen format for rework benches and field service
- Sales unit piece, ready to use once filled

## **APPLICATIONS**

Refreshing joints before desoldering, wetting pads during BGA and QFP rework, spot flux application for wire routing and for repairs in the field.

## **COMPATIBILITY AND SCOPE OF DELIVERY**

Delivery comprises one empty FD-1104-P applicator pen with felt tip, without filling. Suitable for liquid fluxes of common viscosity. Follow the flux manufacturer instructions on material compatibility and storage.
